Pre-Install Checks

Last updated: June 6, 2022

Before installing the software, please ensure the following:

1. While it is not a strict requirement it is good practice to have a full data backup before installing/upgrading applications in Microsoft Dynamics.
2. Make sure you have the installation software saved somewhere that will be accessible from all Microsoft Dynamics Clients.
3. You have the necessary permissions to run the Install application with Administrator privileges on all of the Microsoft Dynamics Client machines.
4. You have the ability to login to Microsoft Dynamics using the "sa" user. The "sa" user must be used and another user with identical privileges will not work.
5. You have valid registration keys for the application being installed.
6. There are no users logged into Microsoft Dynamics GP as this could adversely affect the installation process.
